At the windfield answer plot, we got to learn about how much corn could grow in an acre. We talked about corn diseases and how they could affect the amount of produce each harvest. One topic was learning how to calculate the yield of an area of corn by counting how many stalks are in a row and how many kernels are on the corn. Then we got a demonstration on the drone. The drone can help oversee the fields and studying the crops. The tractor was used for fertilizing the corn and I got to go inside the tractor to operate the arms of the tractor. Overall, it was a really unique experience. Learning at the windfield answer plot taught me a lot and I became a lot more interested in the subject!
